

C960 Headset Programming Instructions

- 1) Make sure the headset is off but has a good battery in it and the base station is on.
- 2) Plug the programming cable into the headset. Take care that the 3 holes in the end of the cable are properly lined up with the 3 pins in the headset. The other end of the cable should be plugged into the base station.
- 3) Turn the headset on. Just press the "On" button and let go. Do not continue to hold the "On" button down.
- 4) Listen and wait for the programming tones to finish before unplugging the cable from the headset. This should take almost 10 seconds. If the tones do not quit, this is ok. 10 seconds is enough for the programming to take. You do not need to turn the headset off before unplugging the cable.
- 5) Test the headset.
